# Insurance Charges Prediction Using Machine Learning Regression Models

#### **Dataset:**

This dataset contains information about individuals and their medical insurance charges. It is used to predict insurance charges based on features like age, sex, BMI, children, smoking status, etc.,

#### **Dataset dimensions:**

Total Records (Rows): 1338

Total Features (Columns): 6

|      | age | sex    | bmi    | children | smoker | charges     |
|------|-----|--------|--------|----------|--------|-------------|
| 0    | 19  | female | 27.900 | 0        | yes    | 16884.92400 |
| 1    | 18  | male   | 33.770 | 1        | no     | 1725.55230  |
| 2    | 28  | male   | 33.000 | 3        | no     | 4449.46200  |
| 3    | 33  | male   | 22.705 | 0        | no     | 21984.47061 |
| 4    | 32  | male   | 28.880 | 0        | no     | 3866.85520  |
|      |     |        |        |          |        |             |
| 1333 | 50  | male   | 30.970 | 3        | no     | 10600.54830 |
| 1334 | 18  | female | 31.920 | 0        | no     | 2205.98080  |
| 1335 | 18  | female | 36.850 | 0        | no     | 1629.83350  |
| 1336 | 21  | female | 25.800 | 0        | no     | 2007.94500  |
| 1337 | 61  | female | 29.070 | 0        | yes    | 29141.36030 |

1338 rows × 6 columns

# **Pre-Processing methods:**

To prepare the dataset for machine learning regression models, the following pre-processing steps were performed.

# 1. Handling Categorical (Nominal) Data:

Two columns in the dataset were categorical and needed to be converted to numeric values:

| Column | Туре    | Encoding Applied    | Details                 |  |
|--------|---------|---------------------|-------------------------|--|
| sex    | Nominal | One-Hot Encoding    | Converted to sex_male   |  |
|        |         | (drop_first = True) | (1 = male, 0 = female)  |  |
| smoker | Nominal | One-Hot Encoding    | Converted to smoker_yes |  |
|        |         | (drop_first = True) | (1 = smoker, 0 = non-   |  |
|        |         |                     | smoker)                 |  |

# 2. No Encoding Needed for Numeric Columns:

Columns such as age, bmi, children, charges are numerical. No conversion required.

| Column   | Туре                    | Action     |
|----------|-------------------------|------------|
| age      | Numeric (int)           | Used as-is |
| bmi      | Numeric (float)         | Used as-is |
| children | Numeric (int)           | Used as-is |
| charges  | Numeric (float, output) | Used as-is |

|      | age | bmi    | children | charges     | sex_male | smoker_yes |
|------|-----|--------|----------|-------------|----------|------------|
| 0    | 19  | 27.900 | 0        | 16884.92400 | 0        | 1          |
| 1    | 18  | 33.770 | 1        | 1725.55230  | 1        | 0          |
| 2    | 28  | 33.000 | 3        | 4449.46200  | 1        | 0          |
| 3    | 33  | 22.705 | 0        | 21984.47061 | 1        | 0          |
| 4    | 32  | 28.880 | 0        | 3866.85520  | 1        | 0          |
|      |     |        |          |             |          |            |
| 1333 | 50  | 30.970 | 3        | 10600.54830 | 1        | 0          |
| 1334 | 18  | 31.920 | 0        | 2205.98080  | 0        | 0          |
| 1335 | 18  | 36.850 | 0        | 1629.83350  | 0        | 0          |
| 1336 | 21  | 25.800 | 0        | 2007.94500  | 0        | 0          |
| 1337 | 61  | 29.070 | 0        | 29141.36030 | 0        | 1          |

Criterion: absolute\_error

n\_estimators: 100

max\_features: float (max\_features)

R<sup>2</sup> Score: 0.8741

#### **Final Model Selection:**

Among all the regression models developed, including Multiple Linear Regression, Support Vector Machine (SVM), and Decision Tree Regressor – the Random Forest Regressor consistently outperformed the others in terms of R<sup>2</sup> Score, which measures the proportion of variance in the target variable(charges).

#### **Reason for selecting Random Forest:**

- Highest R<sup>2</sup> Score (0.8741) this indicates the best predictive performance among all tested models.
- It aggregates multiple decision trees, reducing variance and overfitting, especially effective on datasets with nonlinear relationships.
- Performs well even with noisy or moderately imbalanced data.
- Hyper tunning parameters (n\_estimators, criterion, max\_features) allowed the model to generalize well on unseen data.

#### Final Model: Random Forest Regressor (R<sup>2</sup> Score: 0.8741)

The Random Forest Regressor with absolute error loss and optimized parameters chosen as the final model due to its high predictive accuracy and robust performance in handling the insurance dataset.
